# Yule-Walker Equations

Let  $x_t$  be a causal AR( $p$ ) process:

$$x_t = \sum_{j=1}^p \phi_j x_{t-j} + w_t, \quad \text{where } w_t \sim \text{wn}(0, \sigma_w^2),$$

then the following system of equations (called *Yule-Walker equations*) holds:

$$\begin{aligned} \gamma(h) &= \phi_1 \gamma(h-1) + \dots + \phi_p \gamma(h-p), \quad h = 1, 2, \dots, p, \\ \sigma_w^2 &= \gamma(0) - \phi_1 \gamma(1) - \dots - \phi_p \gamma(p). \end{aligned}$$

# Yule-Walker Estimation

Consider the *Yule-Walker equations*

for a causal AR( $p$ ) process  $x_t = \sum_{j=1}^p \phi_j x_{t-j} + w_t$ :

$$\begin{aligned}\gamma(h) &= \phi_1 \gamma(h-1) + \dots + \phi_p \gamma(h-p), \quad h = 1, 2, \dots, p, \\ \sigma_w^2 &= \gamma(0) - \phi_1 \gamma(1) - \dots - \phi_p \gamma(p).\end{aligned}$$

If we replace  $\gamma(h)$  by the sample autocovariance function  $\hat{\gamma}(h)$  (i.e. use method of moments),  
we get the estimates  $\hat{\phi}_1, \dots, \hat{\phi}_p$  and  $\hat{\sigma}_w^2$  (namely Yule-Walker estimators)  
for unknown parameters  $\phi_1, \dots, \phi_p$  and  $\sigma_w^2$ , respectively, as a solution to  
the following linear system of equations:

$$\begin{aligned}\hat{\gamma}(h) &= \hat{\phi}_1 \hat{\gamma}(h-1) + \dots + \hat{\phi}_p \hat{\gamma}(h-p), \quad h = 1, 2, \dots, p, \\ \hat{\sigma}_w^2 &= \hat{\gamma}(0) - \hat{\phi}_1 \hat{\gamma}(1) - \dots - \hat{\phi}_p \hat{\gamma}(p).\end{aligned}$$

# Yule-Walker Estimation for ARMA?

Can we do same for  $MA(q)$  and general  $ARMA(p, q)$ ?

Yes, but the Yule-Walker equations are more complex and as a result the Yule-Walker estimators are not efficient (not “optimal”).

# Maximum Likelihood and Least Squares Estimation

Consider the following causal AR(1) process

$$x_t = \mu + \phi(x_{t-1} - \mu) + w_t, \text{ where } w_t \stackrel{\text{iid}}{\sim} \mathcal{N}(0, \sigma_w^2).$$

Given observations  $x_1, x_2, \dots, x_n$ , the likelihood function is then

$$\begin{aligned} L(\mu, \phi, \sigma_w^2) &= f(x_1, x_2, \dots, x_n \mid \mu, \phi, \sigma_w^2) \\ &= f(x_1 \mid \mu, \phi, \sigma_w^2) f(x_2 \mid x_1, \mu, \phi, \sigma_w^2) \cdots f(x_n \mid x_{n-1}, \mu, \phi, \sigma_w^2) \\ &= f(x_1 \mid \mu, \phi, \sigma_w^2) f_w((x_2 - \mu) - \phi(x_1 - \mu)) \cdots f_w((x_n - \mu) - \phi(x_{n-1} - \mu)) \end{aligned}$$

and since  $x_t \mid x_{t-1}, \mu, \phi, \sigma_w^2 \sim \mathcal{N}(\mu + \phi(x_{t-1} - \mu), \sigma_w^2)$ , we get

$$L(\mu, \phi, \sigma_w^2) = f(x_1 \mid \mu, \phi, \sigma_w^2) \prod_{t=2}^n f_w((x_t - \mu) - \phi(x_{t-1} - \mu)),$$

where  $f_w(z) = \frac{1}{\sqrt{2\pi}\sigma_w} e^{-\frac{z^2}{2\sigma_w^2}}$  is the pdf of  $w_t$ .

# Maximum Likelihood and Least Squares Estimation

Because  $x_t$  is causal, we can write:

$$x_1 = \mu + \sum_{j=0}^{\infty} \phi^j w_{1-j}, \quad \text{i.e. } x_1 \sim \mathcal{N}\left(\mu, \frac{\sigma_w^2}{1 - \phi^2}\right).$$

Then

$$\begin{aligned} L(\mu, \phi, \sigma_w^2) &= f(x_1 | \mu, \phi, \sigma_w^2) \prod_{t=2}^n f_w((x_t - \mu) - \phi(x_{t-1} - \mu)) \\ &= \left( \frac{1}{\sqrt{2\pi}\sigma_w} \right)^n (1 - \phi^2)^{\frac{1}{2}} e^{-\frac{S(\mu, \phi)}{2\sigma_w^2}}, \end{aligned}$$

where

$$\underbrace{S(\mu, \phi)}_{\substack{\text{unconditional} \\ \text{sum} \\ \text{of squares}}} = (1 - \phi^2)(x_1 - \mu)^2 + \sum_{t=2}^n [(x_t - \mu) - \phi(x_{t-1} - \mu)]^2.$$

# Maximum Likelihood and Least Squares Estimation

Alternatively, we could drop  $x_1$  (i.e. condition on  $x_1$ ) and write

$$\begin{aligned} L(\mu, \phi, \sigma_w^2 | x_1) &= \prod_{t=2}^n f_w((x_t - \mu) - \phi(x_{t-1} - \mu)) \\ &= \left( \frac{1}{\sqrt{2\pi}\sigma_w} \right)^{n-1} e^{-\frac{S_c(\mu, \phi)}{2\sigma_w^2}}, \end{aligned}$$

where

$$\underbrace{S_c(\mu, \phi)}_{\substack{\text{conditional} \\ \text{sum} \\ \text{of squares}}} = \sum_{t=2}^n [(x_t - \mu) - \phi(x_{t-1} - \mu)]^2.$$

# Maximum Likelihood and Least Squares Estimation

If we have a general ARMA( $p, q$ ), which is also **Gaussian** and causal, one can similarly write the likelihood function.

- Definition of *Pure* Seasonal ARMA
- Definition of *Mixed* Seasonal ARMA
- Definition of *Multiplicative* Seasonal ARIMA (SARIMA)

# Definition of Autoregressive Integrated Moving Average (ARIMA)

Def.

If  $\nabla^d x_t$  is  $\text{ARMA}(p, q)$ , then  $x_t$  is called

Autoregressive Integrated Moving Average,  $\text{ARIMA}(p, d, q)$ .

# Definition of Autoregressive Integrated Moving Average (ARIMA)

Note:

If  $x_t$  is ARIMA( $p, d, q$ ) with  $E[\nabla^d x_t] = \mu$ , then one can write

$$\phi(B) \underbrace{(1 - B)^d}_{\nabla^d x_t} x_t = \delta + \theta(B)w_t,$$

where  $\delta = \mu(1 - \phi_1 - \dots - \phi_p)$ .
